

Travel Intelligence AI – Problem Statement

Project Title

Travel Intelligence AI: An Agentic AI-Based Travel Planning and Budget Optimization System

Domain

Travel and Tourism

Problem Statement

Planning a trip requires users to spend significant time researching destinations, estimating travel costs, selecting suitable accommodations, organizing daily itineraries, and managing budgets. Existing travel planning methods often rely on multiple websites and manual comparisons, making the process time-consuming, inefficient, and prone to overspending. Many travelers also struggle to optimize their expenses while ensuring a personalized travel experience based on their preferences.

There is a need for an intelligent travel assistant that can automate travel planning, provide personalized recommendations, and optimize travel budgets through Artificial Intelligence.

Objective

The objective of this project is to develop an AI-powered travel assistant that generates personalized travel itineraries and optimized budget recommendations based on user preferences such as source location, destination, budget, trip duration, travel type, number of travelers, and interests. The solution aims to simplify travel planning, reduce manual effort, and enable users to make informed travel decisions through intelligent AI-generated recommendations.

Expected Outcome

- Personalized day-wise travel itineraries.
- Intelligent budget optimization and cost-saving suggestions.
- Real-time AI-powered travel recommendations.
- User-friendly web application developed using Streamlit and IBM watsonx Orchestrate.
